2 ABSTRACT OF THE DISCLOSURE

handle is removed by cutting or breaking away.

The disclosed apparatus and method for facilitating surface treatment of articles of manufacture of the type having a given handling surface, such as, for example, blank forms for optical lenses, includes a support for holding the article in a stable position, a source for sequentially aligning elongate stem elements in a desired orientation relative to the article, a mechanism for advancing a free end of the stem into contact with the article, and a securing mechanism [26] for attaching the free end of the stem element to the article so that the stem extends from the article to serve as a handle for manipulation and support during processing. The
